HEMATOLOGY

Complete Blood Count

Test Description	Result	Unit	Reference Range
Hemoglobin Method: Cyanmethemoglobin optical detection	13.7	gms/dl	12 - 18
RBC INDICES			
RBC Count	4.61	mil./cmm	4.5 - 6.5
Haematocrit (HCT)	40.2	%	37 - 54
MCV	87.20	fL	80 - 100
MCH	29.72	pg	27 - 34
MCHC	34.08	gm/dl	32 - 36
RDW-CV	14.3	%	11 - 16
Total WBC Count Method: Flow cytometry using semiconductor laser	12800	/uL	4500 - 11000
DIFFERENTIAL COUNT			
Neutrophil	80	%	40 - 70
Lymphocytes	13	%	20 - 40
Monocytes	04	%	2 - 8
Eosinophil	03	%	1 - 6
Basophils	00	%	0 - 1
PLATELET INDICES			
Platelet Count Method: Sheath flow DC Detection	234000	/cmm.	150000 - 450000
RBC Morphology	Normocytic Normochromic		
WBC Morphology	Reactive Lymphocytes		
Platelet	Adequate on smear

CLINICAL PATHOLOGY

WIDAL TEST AGGLUTINATION

Test Description	Result	Unit	Reference Range
S. Typhi 'O'	Agglutination 1:80		No Agglutination
S. Typhi 'H'	Agglutination 1:80		No Agglutination
S.Paratyphi A(H)	No Agglutination		No Agglutination
S.Paratyphi B(H)	No Agglutination		No Agglutination
Result :	Test is Positive		

Test Information

Agglutination titer greater than 1:80 is considered significant.

The past history of enteric fever or inoculation of vaccine can interfere with the result.

Clinical significance:

1. The organism Salmonella typhi is responsible for causing enteric fever/typhoid fever, which is characterized by high consistent fever, loss of appetite, transitory bacteremia, round or oval-shaped ulcers on the smooth peritoneal surface of Peyer's patches, etc.
2. The organism possesses an 'O' antigen on the cell wall and 'H' antigen on its flagella, against which the host body produces immunospecific antibodies.
3. Paratyphoid fever caused by Salmonella paratyphi A or B is characterized by a milder course of the disease.
4. These organisms also possess somatic 'O' and flagellar antigen termed as A(H) and B (H) respectively
